To: fellows@science-corps.org

Name

Anuradha Vibhakar

Gender

Female

Nationality

British

Emailanuradha.vibhakar@physics.ox.ac.uk**When did or will you finish your PhD?**

June 2021

City, state, and country of residence

United Kingdom

University education

Doctor of Philosophy (DPhil) | Condensed Matter Physics | University of Oxford | June 2021 (expected)

MSci | Natural Sciences: Inorganic and Materials Chemistry and Condensed Matter and Nano Physics | University College London | 2012 - 2017 | First

What are your reasons for applying to be a Science Corps Fellow? (max. 200 words)

I love the scientific method. I love using the combination of logic and creativity to solve problems, and potentially expand our knowledge of the world. As I draw closer to the end of my PhD I do not want to immediately being the next step of my career, which I hope to be in academia, rather I would like to utilise the scientific skills and experience I have gained through my studies and have the experience of teaching and working abroad. I am passionate about teaching science in a way that will inspire students to think creatively and

logically, and help avoid techniques of rote learning that are sometimes so prevalent in the curriculum of many schools. I am excited by the challenge that being a science corps fellow will entail, especially the challenge of creating tools and experiments to demonstrate key scientific concepts within a limited set of resources. I believe I gained a lot of scientific intuition in my PhD by being able to discuss my work with my group, supervisor and other colleagues and would hope to promote this amongst the students and staff alike. I have always wanted to work abroad and especially in India, where my heritage and culture are from. I would also love to use this opportunity to travel around India and develop my basic level of Hindi.

In addition to your studies, describe any relevant experiences that have prepared you for a Science Corps fellowship (max. 200 words)

Besides my studies I have participated in summer projects that focused on developing resources to crowdsource sustainable development in line with the UN's 17 Sustainable Development Goals. This involved working together with other university students, from a broad range of disciplines and cultures, and with high school children. I was involved in two projects. The first was to develop a low cost arsenic detector to be used where arsenic posing is a key issue in preventing access to safe drinking water. The second was developing a low cost atomic force microscope. Both projects involved teaching the high school students new skills such as CAD, 3D printing and some general chemistry/ physics.

Where do you imagine yourself professionally in the future? Check all that apply.

Academic scientist in academia
Doing science in industry
Other

If other, please specify.

Scientific policy within the government

Expand on your selection above and describe where you imagine yourself professionally in the near (2 year) and long-term (10 year) future (max. 200 words)

I hope to do a post doc in the near future (after the science corps fellowship), with the aim of developing independent research skills so as to lead my own research group in the long-term. However I am aware of the challenges involved in doing academia, and would also love to do a job engaged in scientific policy or something that involves promoting the role of women and or minorities in stem, should an academic career not transpire.
