To: fellows@science-corps.org

Name

Tolulope Perrin-Stowe

Gender

Female

Nationality

U.S.A

Emailtolulope.perrinstowe@gmail.com**When did or will you finish your PhD?**

May 2021

City, state, and country of residence

Urbana, Illinois, U.S.A

University education

Doctorate, Ecology, Evolution, and Conservation Biology, University of Illinois at Urbana-Champaign, Doctoral Defense passed, degree date May 2021
Bachelors, Zoology, Miami University of Ohio, May 2014

What are your reasons for applying to be a Science Corps Fellow? (max. 200 words)

I am applying to be a Science Corps Fellow because I want to see more researchers and scientists from underrepresented communities. During my graduate studies, I have been a teaching assistant in a total of 14 courses. I really have a passion for science education and research mentoring. I have been a merit teacher in several of those courses where I had the pleasure of teaching students that came from very diverse backgrounds and required innovative teaching methods. Working with students in the various ways that helped them to have a better understanding of the material, whether it was more visual education, tactile-

based learning, or student-led discovery helped me to become a better researcher and educator. It also helped me to see how much of an asset to research and science these young students had the potential to become. I also have a passion for community-based initiatives, I believe they are the more equitable and impactful way to engage early researchers and involve the average person more directly with science, their environment and their voice in those areas.

In addition to your studies, describe any relevant experiences that have prepared you for a Science Corps fellowship (max. 200 words)

To complement my research skills, I also have experience in outreach, education, and communication methods. I have led courses, mentored students, and organized symposiums and conferences. I have taught courses on conservation, animal biology and behavior, and environmental justice. For these courses, I have designed labs, written assessments, designed coursework and educated students on different biological systems. I also had the pleasure of mentoring two undergraduate students during my time as a graduate researcher. I have taken workshops in both science communication and how to build community-based conservation plans that are sustainable and equitable. Lastly, I was a committee chair member for two research symposiums and a national diversity conference. These positions included working with diverse teams, managing multiple projects, and reporting to a national organization's executive board. Such experiences have prepared me to succeed and collaborate in leadership roles and find innovative ways to tackle new technologies, concepts, and projects.

Where do you imagine yourself professionally in the future? Check all that apply.

Other

If other, please specify.

Research scientist and educator in conservation-focused institutions

Expand on your selection above and describe where you imagine yourself professionally in the near (2 year) and long-term (10 year) future (max. 200 words)

In two years, I see myself gaining further experiences and broadening my skill set in a post-doctoral position. I am a conservation-focused researcher and my background is in population genetics, genomics, and evolutionary biology. I would like to increase my experience working directly with communities on conservation projects and increase the diversity of species I have worked with (I have primarily worked with endangered mammals). I would also like to contribute to genetic management plans of endangered or threatened species. In ten years, I hope to have a position in an organization like the Association of Zoos and Aquariums (AZA) or the International Union for the Conservation of Nature (IUCN) where I am able to use my research skills to directly solve conservation issues. I really enjoy research but I do find the lack of direct application, which is often the case in academia, to be an issue and a barrier to me wanting an academic position. In the conservation organization I see myself employed in, I would like to have the freedom to work with local communities and be able to provide education to young researchers possibly with an affiliate position.
